

Sunrise 25.1 Clinicals

Sunrise™ 25.1 Clinicals improves the healthcare experience by enhancing usability for increased provider efficiency and satisfaction, prioritising patient safety, streamlining configuration and management, and automating administrative tasks—helping clinicians focus more on patient care through real-time insights and simplified workflows.

Key enhancements:

RxWriter—Offers a redesigned interface that presents a compact layout with functional icons on each tab, enabling intuitive and efficient navigation. Easily accessible favorites and the repositioning of the free text input further enhance usability.

Orders—Enables orders to be entered, viewed and maintained at the patient level, aligning with clinical workflows and enhancing provider satisfaction. The improved order function simplifies searches by not requiring exact wording.

Results—Delivers the ability to filter deleted results and sort allergies by severity, which enables providers to swiftly access critical information, enhancing care quality. Additionally, the ability to annotate multiple results within a single workflow streamlines processes.

Preferred name and pronouns—Includes fields for preferred names and pronouns, which fosters more personalised care, increasing patient satisfaction by ensuring their preferences are recognised.

Configuration tools—Offers an uplifted user interface with search capability to simplify access to settings, which in turn enables modification to enhance the overall user experience.
